COMMENTS

FIGURE ${ }^{3}$. Ophthalmic test result form (Translation)

## 1. Adjust chair

Ideally the seat squab should be approximately 3 cm below the back of the legs when bent at $90^{\circ}$ into the seated position. The chair backrest should support the pelvis and not the small of the back.

## 2. Adjust the desk height

Ensure that the desk is adjusted such that with the hends on the centre of the keyboard the arms are bent at approximately $90^{\circ}$.

3. Adjust the angle of the datascreen

Adjust the angle of the datascreen until it is at right angles (ie 'normal') to the line of sight. If there are any annoying reflections tell the experimenter and then try to remove them by changing the angle. You will probably find that any reflections will be reduced by tilting the screen towards you.
4. Adjust the fore and aft position of the keyboard

Adjust the keyboard to its most comfortable position.

## 5. General position

Ensure that datascreen, keyboard and chair are in a straight line.
6. Adjust the brightness and contrast of the datascreen

Usc the two knobs below the screen to adjust the brightness of the image and the difference in brightness between the image and the background

| Character sharpness | 1.91 | 2.55 | 1.55 | 1.91 | 4.09 | 1.91 | $\mathrm{p}<0.001$ |
| Character wobble | 2.00 | 4.18 | 4.00 | 1.09 | 1.27 | 1.09 | p<0.001 |
| Background steadiness | 1.91 | 3.27 | 4.55 | 1.18 | 1.73 | 1.45 | $\mathrm{p}<0.001$ |
| Reflections of lights | 3.54 | 4.82 | 4.73 | 2.91 | 4.55 | 4.82 | $\mathrm{p}<0.01$ |
| Reflections of operator | 2.18 | 4.00 | 3.6 .4 | 1.73 | 2.64 | 3.91 | $\mathrm{p}<0.01$ |
| Colour | 1.64 | 2.82 | 2.09 | 2.18 | 2.00 | 1.82 | N.S |
| Overall acceptability | 2.27 | 3.00 | 3.09 | 2.72 | 3.00 | 2.09 | N.S |

Note: A rating of 1 is ideal and 5 is very bad.
Significance assessed by Kruskal-Wallis one-way analysis of variance with correction for ties. A separate
analysis of variance across all six screen designs was carried out for each of the screen characteristics.
TABLE 4. Crude Comparison of Screens Based on Significantly Different Ratings of Screen Characteristics given

| Screen Characteristics | Screen A1 <br> P31 Phosphor <br> + matt green polaroid filter | Screen A2 <br> P31 Phosphor <br> + matt neutra <br> polaroid <br> filter | $\begin{aligned} & \text { Screen A3 } \\ & \hline \text { P31 Phosphor } \\ & \text { 1. matt green } \\ & \text { 3M LCF } \\ & \text { filter } \end{aligned}$ | Screen B1 <br> P39 Phosphor <br> + matt green <br> polaroid <br> filter | $\begin{aligned} & \text { Screen B2 } \\ & \hline \text { P39 Phosphor } \\ & \text { + matt neutra } \\ & \text { polaroid } \\ & \text { filter } \end{aligned}$ | Screen B3 <br> P39 Phosphor <br> 1.matt green <br> 3M LCF <br> filter |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Flicker | 2 | 3 | 3 | 1 | 1 | 1 |
| Character sharpness | 1 | 2 | 1 | 1 | 4 | 1 |
| Character wobble | 2 | 4 | 4 | 1 | 1 | 1 |
| Background stability | 1 | 3 | 4 | 1 | 1 | 1 |
| Reflections of lights | 3 | 4 | 4 | 2 | 4 | 4 |
| Reflections of operator | 2 | 4 | $3:$ | 1 | 2 | 3 |

*Note: Score of 1 has average rating between 1 and 1.99. (Good performance)
Score of 4 has average rating between 4 and 4.99. (Poor performance)
It can be seen that screen Bl gained good ratings on five screen characteristics.
TABLE 4. Crude Comparison ${ }^{*}$ of Screens Based on Significantly Different Ratings of Screen Characteristics given

## in Experiment 1. (See Table 3)

| Screen Characteristics | Screen A1 <br> P31 Phosphor <br> + matt green polaroid <br> filter | Screen A2 <br> P31 Phosphor <br> + matt neutra <br> polaroid <br> filter | $\begin{aligned} & \text { Screen A3 } \\ & \text { P31 Phosphor } \\ & \text { 1, matt green } \\ & \text { 3M LCF } \\ & \text { filter } \end{aligned}$ | Screen B1 <br> P39 Phosphor + matt green polaroid filter | Screen B2 <br> P39 Phosphor <br> + matt neutra polaroid <br> filter | Screen B3 <br> P39 Phosphor <br> 1.matt green <br> 3M LCF <br> filter |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Flicker | 2 | 3 | 3 | 1 | 1 | 1 |
| Character sharpness | 1 | 2 | 1 | 1 | 4 | 1 |
| Character wobble | 2 | 4 | 4 | 1 | 1 | 1 |
| Background stability | 1 | 3 | 4 | 1 | 1 | 1 |
| Reflections of 1ights | 3 | 4 | 4 | 2 | 4 | 4 |
| Reflections of operator | 2 | 4 | 3 : | 1 | 2 | 3 |

*Note: Score of 1 has average rating between 1 and 1.99. (Good performance)
Score of 4 has average rating between 4 and 4.99. (Poor performance)
It can be seen that screen B1 gained good ratings on five screen characteristics.

TABLE 5. Results of visual screening test prior to Experiment 2.

| Test no.* | Description of test (see Appendix 3) | Subject <br> Group 1 <br> who used <br> Screen AO <br> P31 Phosphor <br> with matt <br> finish | Subject <br> Group 2 <br> who used <br> Screen B3 <br> P39 Phosphor plus 3M LCF filter | Subject <br> Group 3 <br> who used <br> Screen B1 <br> P39 Phosphor <br> plus Green <br> Pol. filter | Subject <br> Group 4 <br> who used <br> Screen Al <br> P39 Phosphor <br> plus Green <br> Pol. filter |

|  | TOTAL | 9 Y 1 R | 10Y 2R | 4Y 2R | - - |

See Appendix 3 for position on recording form of tests noted here.
I The numbers with ' $Y$ ' as suffix indicate the number of subjects in that group whose vision on that test is below the standard for clerical and administrative jobs as laid down by the Purdue University Standard for the visual screener. The numbers with an ' $R$ ' as suffix indicate seriously lowered visual skills for satisfactory job performance according to the same Purdue Standard.

* The body of the Table contains the mean ratings given by the subjects in each group to the datascreens they The lower the rating the better the score.
¥ Kruskal-Wallis one-way analysis of variance used to determine the statistical
significance of the differences in the mean ratings given to the screens on each of the eight characteristics.

TABLE 13. Results of visual screening test prior to Experiment 3

* See Appendix 3 for position on recording form of tests noted here.
** These results were obtained from the subject group who used Screen B1 in Experiment 2
I The numbers with ' $Y$ ' as suffix indicate the number of subjects in that group whose vision on that test is below the standard for clerical and administrative jobs as laid down by the Purdue University Standard for the visual screener. The numbers with an ' $R$ ' as suffix indicate seriously lowered visual skills for satisfactory job performance according to the same Purdue Standard.

TABLE 14. Results from pre-task questionnaire, subjects' eye condition before Experiment 3.

Results from pre-task questiomnaire, subjects eye condition before Experiment 5

Cont.

TABLE 33 : Results from pre-task questionnaire, subjects eye condition before Experiment 5 (continued).

| Number in group |
| :--- |
|  |
| C6a Can you wear your spectacles for |

C6b Can you wear your lenses for long periods

C7a Do your spectacles make your eyes Tired?
Dry?
Irritated?
More sensitive to light
C7b Do your lenses make your eyes
Tired?
Dry?
Irritated?
More sensitive to light

D GENERAL EYE CONDITION
D1 Indicate following symptoms
a Tiredness
b Watering eyes
c Dryness
d Sore tender eyes
e Itching around eyes
f Twitching of eyelids
$g$ Heaviness
$h$ General eyestrain
i Excessive blinking
$j$ Distant objects blurred
$k$ Written text blurred
1 Double vision
D2 Do you get headaches?

D2a Is it possible that these symptoms are connected with eyestrain?

D3 If you have headaches where do they usually occur?

Neck
Back of head
Top of head
Forehead
Behind eyes
All over

## INTRODUCTION

We are investigating the effectiveness of different designs of datascreens which might be used in L.M.E.'s products. We have invited you to participate in some experiments with these devices. The purpose of this questionnaire is to determine the sharpness of your vision and to get to know if you have any (other) visual problems.

The information requested in this questionnaire will be treated in a highly confidential manner by the researchers and will not be passed on to anyone else, either within or outside L. M. Ericsson, without your express agreement. The experimental data will be published in a composite form so that particular individuals cannot be identified.

If you do not completely understand a question, or if for some reason you cannot answer a question in a suitable manner, ask for help. If for some reason you do not wish to answer a question, strike that question through with a line and you will not be asked that question again.

Finally I would like to take the opportunity of thanking you for your help.
A. GENERAL INFORMATION

Al. Name: • • • • • • . . . . • • • • • • •

A2.

A3. Age: . . . . . . . . . . . . . . . . . . . .

A4. What do you do in L.M.E.?
B. VISUAL CONDITION

B1. Do you suffer from any problems with your eyes?
Yes $\square$ If yes, briefly describe the problems:

No $\square$

B2. Can you see with both eyes?
No $\square$
If no; which eye can you use?
Left
Right

Yes $\square$

B3. Are you colour blind?
Yes $\square$ If yes, is your colour blindness: Light? Moderate? Severe?

No

B4. Do you use, or should you use, spectacies or contact lenses? Yes $\square$ If yes, continue on the next sheet

No If no, go directly to Section $D$ and skip over Section $C$ of the questionnaire.
C. FOR SPECTACLE OR CONTACT LENS USERS

C1. Do you always use spectacles and/or contact lenses when you should?

No If no, give the reason(s):

Yes

C2. When was the last time you visited an optician? (Ignore the visit to the Company optician in connection with this research).

Instruction: If you wear spectacles fill in the left-hand section below. If you wear contact lenses fill in the right hand section. If you wear both spectacles and contact lenses fill in both sections.

FOR SPECTACLE WEARERS FOR CONTACT LENS WEARERS
C3a. How long have you worn spectacles? C3b. How long have your worn contact lenses?
C4a. What sort of spectacles have you? C4b. What sort of contact lenses have youi
Ordinary
Bifocal
Trifocal
Other
Hard lenses

- Soft lenses

Other
If your answer falls in the last category,
If your answer falls in the last category, what sort of lenses do you have? what sort of spectacles do you have?

C5a Are the spectacles tinted?
Yes
No
C6a. Can you wear your spectacles for long periods at a time?

Yes
No
C7a. Do your spectacles make your eyes: Tired
Dry
Irritated
More sensitive
to light

C5b. Are the contact lenses tinted?
Yes
No
C6b. Can you wear your contact lenses for long periods at a time? Yes
No
C7b. Do your contact lenses make your eyes: Tired

Dry
Irritated
More sensitive
to light
D. GENERAL CONDITION OF THE EYES

D1. Put a cross to indicate how often you experience the following symptoms:

Tiredness in the eyes (eye fatigue)
Watering eyes
Dryness in the eyes (dry eyes)
Sore (tender) eyes
Itching round the eyes
Twitching of the eyelids
Heaviness in the eyes
General feeling of eyestrain

Excessive blinking
Objects a long way away become blurred
Written text becomes blurred
Double vision

D2. Do you get headaches?

Is it possible that these symptoms are tied up with eye-strain?

Never
D3. When you read, do you suffer from pain in the: Head?
Neck?
Shoulders?
Back?
Some other place?

If your answer falls in the
last category, indicate when the pain occurs.

D4. Do you suffer from some sort of eye-strain when you:
Read?
Look at television?
Go to the films?
Drive a car?

I don't drive a car $\square$

D5. Do you suffer discomfort from strong light?
Yes $\square$
No $\square$

D6. Do your eyes become irritated by cigarette smoke in a room?

D7. Do your eyes feel especially dry in a room with dry air or when it is dry outside?

## APPENDIX 3. VISUAL SCREENING TEST RESULTS FORM FOR PHASE II (SWEDISH)

| No flicker |  |  |  |  |  | Unacceptable flicker |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Clear characters |  |  |  |  |  | Blurred characters |
| Characters wobble |  |  |  |  |  | Steady characters |
| Steady background |  |  |  |  |  | Moving background |
| Reflections from the <br> lighting can be seen |  |  |  |  |  | No reflections from the <br> lighting can be seen |
| No reflections of you <br> can be seen |  |  |  |  | Reflections of you can <br> be seen |  |
| Dislike the colour of <br> the characters |  |  |  |  |  | Like the colour of the <br> characters |
| The screen is very <br> acceptable |  |  |  |  |  | The screen is <br> unacceptable |

APPENDIX 4. RATING SCALES FOR SUBJECTIVE ASSESSMENT OF SCREENS DURING PHASE II

Now you have finished this part of the investigation I would like you to fill in another questionnaire. The objective of the questionnaire is to get to know your impressions of the screen and your experience of it after having used it for a short time.

QUESTIONNAIRE 2. AFTER THE INVESTIGATION
A. General information

A1. Name: . . . . . . . . . . . . . . . . .
A2.
B. Feelings in your eyes

B1. Do your eyes feel: Tired?

Put a cross
against as many alternatives as apply.

B2. Has your perception (experience) of colours changed?
Changed a bit $\square$
Changed a lot
Changed a lot $\square$

No change

B3. Have you a headache now?
Yes $\square$
If yes, did you have it before the investigation?

No $\square$
B4. Have you any pains which have appeared since the experiment began?
In the neck
In the shoulders

In the last case, where?

## C. Feelings in your eyes during the experiment

C1. While you worked on the screen, did you experience any visual fatigue? (put a cross against the reply which applies to you) No fatigue
 Little bit
 Much $\square$

C2. Did you feel it necessary to take a pause to rest your eyes?
Yes $\square$ If yes, how often? Every 10 min. $\square$ Every 20 min. $\square$ Every 30 min . $\square$ After 1 hour $\square$

No $\square$
C3. Was the screen easy to work with for 50 minutes?
No $\square$
If no, Why?

Yes $\square$
C4. Did you notice any of the following things on the screen?

Characters became blurred
Characters jumped
Screen flickered
Background rolled
Reflections from lighting on ceiling
Reflections from you
Something else

In which case, what?

C5. Is there anything about the screen which you think should be changed?

Yes $\square$
In this case, what? -

No
$\square$

WHAT IS A CIRCULAR POLARIZER?
HOW DOES IT WORK?
A circular polarizer (CP) consists of a linearlv polarizing filter and a $\frac{1}{4}$ wave retarding element whose slow and fast axes are at 45 to the axis of the pclarizing filter. When a ray of unpolarized light passes through the linearly polarizing filter, it becomes linearly polarized at 45 to the respective axis of the retarder. The action of the linearly polarized light ray upon entering and passing through the $\frac{1}{4}$ wave retarder may be descritsed as the passage of two equal but oppositely nolariced components one retarded with respect to the other by a $\frac{1}{4}$ of a wave lenth. This combination of wave fronts results in a circularly polarized light ray of either left or right hand rotation-similar to a left or right threaded screwdepending upon the initial orientation of the linear and $\frac{1}{4}$ wave elements.

When a circularly polarized light ray is reflected from a specular surface, the sense of rotation. 'رerses with the reflection of the ray. The change in both direction and sense of rotation of the light ray results. on re-entry through the quarter-wave component, in an additional quarter-wave phase shift. The tota! change in phase of the light ray entering and exiting the quarter-wave component is therefore, one-hi"' of a wave length which transforms the circularly polar,ind ray back into a light ray that is linearly polarized in a plane 90 to its original entrance plane. Thus the back reflected $:$ :ght is absorbed by the linearly polarized component of the circular polarizer.

## WHY USE CIRCULAR POLARIZERS FOR CONTRAST IMPROVEMENT?

At any given point on a CRT screen (or simblar instrument) the luminance perceived by $a r^{\circ}$ wer can be considered to be the sum of two contritutions: a perceived luminance, $S$. due to the action of the CRT (signal). and a per eived luminance, N. that is due to the oxternal
illumination (noise). If we consider the ratio of S \& $N$ under two different conditions-with no filter (nf) and with a circular polarizer $(C p)$-we can define a contrast improvement ratio of.

$$
C I R=\frac{(S / N) C p}{(S / N) n f}
$$

By the use of CIR values, we can now compare the contrast improvement effectiveness of a circular polarizer to that obtained with conventional isotropic coloured or neutral fitters.

| Filter <br> Transmittonce | CIR value of typical neutral isotropic filter relative 10 <br> - $\because \quad$ no filter | CIR value of typical neutral circular polarizer relative to no filter |  |
| :---: | :---: | :---: | :---: |
| 40\% | 2.5101 | 100109 | (3 to 1) |
| 30\% | 3.3101 | 130101 | (4 to 1) |
| 20\% | 5101 | 200101 | (6 10 1) |

The CIR values in parentheses are representative of ratios obtained from non-specular - depolarizing - surfaces. Since the surfaces of most CRT phosphors are not completedepolarizers-retention of polarized light varies from $15 \%$ to $35 \%$ typically-the parenthetical values represent minimums for nonspecular surfaces. Considering that reflections from CRTs and,or similar devices are generally both specular and non-specular, it is apparent from above CIR values that circular polarizers are overall far more effective in improving contrast than comparable neutral or coloured isotropic filters. Furthermore, the higher efficiency of the circular polarizer makes it possible to ederate at a hi, 'rer filter transmittance thus avoiding an unnecessary reduction of signal intensity.

## Louvered Filters

Louvered filters are very effective in reducing the amount of bright artificial light or daylight reflected from the face of a display, without a substantial reduction in display emitted light. The construction of a louvered filter is diagrammed in Figure 11. Inside a plastic sheet are thin pirallet louvers which may be oriented at a specific angle with respect to the surface normal. The zero degree louvered filter has the louvers perpendiculat to the filter surface.
The operation of a louvered filter is similar to a venetian bind as shown in Figure 12. Light from the LED display passes between the parallel louvers to the viewer. Off-axis ambent light is blocked by the louvers and therefore is not able to reach the face of the display to be reflected back to the viewer. This results in a very high contrast ratio with minımal loss of display emitted light at the On-axis viewing angle. The trade-off is a restricted viewiñg angle. For example, the zero degree louvered filter shown in Figure 11 has a horizontal viewing angle of 180 , however, the vert cal viewing included angle is $60^{\circ}$. The louver aspect ratio (louver depth/distance between louvers) determines viewing angle. A list of louver option possibilities is given in Table 1 .
Some applications require a louver orientation other than zero degrees. For example, an 18 degree louvered filter may be used on the sloping top surface of a point of sale termi. nal. A second, is the use of a 45 degree louvered filter on overhead instrumentation to block out ambient light from ceiling mounted lighting fixtures.
Louvered filters are effective filters for enhancing the view. ing of LED displays installed in equipment operating under daylight ambient conditions. In bright sunlight, the most effective filter is the crosshatch louvered filter. This is essentially two zero degree neutral density louvered filters orrented at 90 degrees to each other. Red, yellow and green digits may be mounted side by side in the same display. Using only the crosshatch filter, all digits will be clearly visible and easily read in bright sunlight as long as the sun light is not narallet to the viewing axis. The tradeoft is restricted vertical and hotizontal viewing The effective viewing cone is an included angle of $40^{\circ}$ degrees (for a filter aspect ratio of 2.75 1 .

## INTRODUCTION

We have invited you to participate in some experiments. The purpose of this questionnaire is to determine the sharpness of your vision and to get to know if you have any (other) visual problems.

The information requested in this questionnaire will be treated in a highly confidential manner by the researchers and will not be passed on to anyone else, either within or outside L.M.Ericsson, without your express agreement. The experimental data will be published in a composite form so that particular individuals cannot be identified.

If you do not completely understand a question, or if for some reason you cannot answer a question in a suitable manner, ask for help. If for some reason you do not wish to answer a question, strike that question through with a line and you will not be asked that question again.

Finally, I would like to take the opportunity of thanking you for your help.

APPENDIX 8. QUEŚTIONNAIRE 3. EYE CONDITION QUESTIONNAIRE FOR PHASE III (contd.)
The answers from all the subjects in Experiment 5 are shown in italics. For a breakdown of answers by subject groups see Table 2 .
A. GENERAL INFORMATION

Al. Name
A2. Birthdate. Average age of all subjects 42:? years.
A3. Where do you work. 26. from $I M E$. 22 from TeZeverket. . . . . A4. What do you work with? . All. telephone operators. . . . . . . .

* The italic typewriting throughout this questionnaire indicates some of the answers given.

APPENDIX 8. QUESTIONNAIRE 3. EYE CONDITION QUESTIONNAIRE FOR PHASE III (contd.) B. VISUAL CONDITION

B1. Do you suffer from any problems with your eyes?

No 12

B2. Can you see with both eyes?

Yes 27

B3. Are you colour blind?

If yes, is your colour blindness: Light Moderate Severe
$\square$

B4. Do you use, or should you use, spectacles or contact lenses?
Yes 22 If yes, continue on the next sheet
No 6 If no, go directly to Section $D$ and skip over Section $C$ of the questionnaire.
C. FOR SPECTACLE OR CONTACT LENS USERS (22 subjects)

C1. Do you always use spectacles and/or contact lenses when you should? No 4 If no, give the reason(s) . . . . . . . . . . . . . Yes 18
C2. When was the last time you visited an optician? (Ignore the visit to the Company optician in connection with this research). 22.3 months Instruction: If you wear spectacles fill in the left-hand section below. If you wear contact lenses fill in the right hand section. If you wear both spectactles and contact lenses fill in both sections.

## FOR SPECTACLE WEARERS

C3a. How long have you worn your present spectacles? . 29: 8. months.
C4a. What sort of spectacles have you?

| Reading spectacles | 15 |
| :--- | ---: |
| Distance spectacles | 8 |
| Bifocal | 7 |
| Trifocal | - |
| Other | - |

If your answer falls in the last category, what sort of spectacles do you have?

FOR CONTACT LENS WEARERS
C3b. How long have you worn your present contact lenses?

4 months (1 subject)
C4b. What sort of contact lenses have you?

Hard lenses
Soft lenses
Other

If your answer falls in the last category, what sort of lenses do you have?
$\mathrm{C5b}$. Are your contact lenses tinted?

| Yes | - |
| :--- | ---: |
| No | 1 |

C6b. Can you wear your contact lenses for long periods at a time?

| Yes | 1 |
| :--- | ---: |
| No | - |

C7b. Do your contact lenses make your eyes:
Tired
Dry
Irritated
More sensitive
 to light
-
TO BE FILLED IN BY EVERYBODY
D. GENERAL CONDITION OF THE EYES

D1. Put a cross to indicate how often you experience the following symptoms: Never Seldom Often Always

APPENDIX 11. QUESTIONNAIRE 5

ASSESSMENT OF CALL HANDLING EQUIPMENT AND PROCEDURE QUESTIONNAIRE FOR PHASE III
(Italic numbers is the answer boxes indicate the total frequency with which those answers were given)

The purpose of this questionnaire is to collect your opinions of the adequacy of the equipment and the operating procedures used in call handling. Please ring the number corresponding to your answer. Cancel errors with a large cross.
A. DATA SCREEN

Rate the data screen on the following scales (please ring appropriate numbers).

| a.Screen <br> size | Screen much too <br> large |
| :--- | :--- |
| b.Letter <br> size | Letters much too <br> large |
| c.Legibility <br> of letters | Very <br> legibile |
| d.Brightness <br> of letters | Letters much too <br> bright |
| e.Contrast <br> level | Too much <br> contrast |
| f. Flicker | No flicker |

Screen much too small
Letters much too small

Totally illegible
Letters much too dim

Too little contrast
Unacceptable level of flicker

Image very unsteady
Unacceptable reflections of lights

Unacceptable reflections of self

Unacceptable colour
$k$. Other features of the screen on which you wish to comment

## B. TICKET FORMAT

The call handling 'ticket' is composed of fields, each identified by a name (eg ORDER) and containing information (contents) entered either by the operator, via the keyboard or by the computer. The cursor is the flashing underline symbol indicating where the information entered on the keyboard will appear.

Please answer the following questions relating to the format.

B1. How easy was it to learn the positions of the fields?

B2. How easy was it to learn the orders which had to be entered into the computer?

| Very easy | Easy | Difficult | Very difficult |
| :---: | :---: | :---: | :---: |
| 0 | 15 | 12 | $\square$ |

B3. How easy was it to enter information into the order field?

| Very easy | Easy | Difficult. | Very difficult |
| :---: | :---: | :---: | :---: |
|  | $\boxed{ } \quad$ | 15 | 10 |

B4. How often do you think that you made mistakes when writing orders which you corrected before transmitting them?

| Never | Seldom | Often | Very often |
| :---: | :---: | :---: | :---: |
| $\square$ | 7 | 13 | $\boxed{8}$ |

B5. How often do you think that you misread or misinterpreted orders or information on the data screen?

| Never | Seldom | Often | Very often |
| :---: | :---: | :---: | :---: |
| $\square$ | 14 | 12 | 2 |

B6. Was it easy to enter $A$ and $B$ numbers onto the data"screen?

| Very easy | Easy | Difficult | Very difficult |
| :---: | :---: | :---: | :---: |
| $\boxed{6}$ | 22 | $\square$ |  |

B7. How easy was it to find the cursor on the screen?

| Very easy | Easy | Difficult | Very difficult |
| :---: | :---: | :---: | :---: |
| 11 | 15 | 2 | $\square$ |

B8. Was the cursor distracting? :

| Never <br> distracting | Seldom <br> distracting | Often <br> distracting | Always <br> distracting |
| :---: | :---: | :---: | :---: |
| $\boxed{21}$ | $\boxed{6}$ | $\boxed{\cdots}$ | $\square$ |

B9. How easy was it to appreciate the state of the subscribers? (eg Engaged)

| Very easy | Easy | Difficult | Very difficult |
| :---: | :---: | :---: | :---: |
| 11 | 16 | $\square$ |  |

B10. How easy was it to appreciate the connection between the operator and the subscribers? (eg Speak to A)

| Very easy | Easy | Difficult | Very difficult |
| :---: | :---: | :---: | :---: |
| 5 | 15 | $\square$ | $\square$ |

B11. Are there any further points you wish to make regarding the format of the data scale (if yes, describe them below)

Yes

APPENDIX 12. (cont'd) DETAILED CALL HANDLING PROCEDURE FOR SUCCESSFUL DEMAND CALL.

demand operation
Incoming_calle_ne_direst_acsess
A ticket is set up on the display with the following information filled in:
DEMAND incoming call from a subscriber or operator in another exchange call type
$\begin{array}{ll}\text { ACAT } & \text { The A subscriber's category } \\ \text { A ANSWER } & \text { the A subscriber in answer. } \\ \text { DOSition }\end{array}$ oun signature
TYC
Press $S M$ to answer the call. The call must be answered within 30 s .
$0=x==33>A$ speech connection $0===== \pm>B$ to the $A$ and $B$ sides The announcing machine answer is heard. When the announcing machine answer ends, speech connection is established to the $A$ subscriber.
If a tone pulse is heard instead of the announcing machine answer, the answer should be read out by the operator.
EVENT
Pateris
ACKROMCEDEEAENA

Inc\&ming_calle_direst_access
The procedure is the same as in the case of no direct access, except thai the call is not answered by pressing SM. The announcing machine answer thus comes directly when the ticket is set up.

APPENDIX 12. (Cont'd) DETAILED CALL HANDLING PROCEDURE
Reseestion_0f_bequings

> Write the $A$ subscriber number in the A-NR field. If there is automatic transmission of the $A$ number, the $A$ number is atready specified in the $A-N R$ field on the ticket. If there is not automatic $A$ number transfer, a check of the $A$ number given by the subscriber can be made according to $15.1-15.11$ Write the 87 fietd. As regards different ways of writing the B number see 2.20

If the A subscriber wishes special services, such as call priority, personal call, limited duration, price advice etc.. these are noted in the ORDER field according to 8.1-8.14

If the $A$ subscriber wants to order delay service, the procedure is according to 6.2

If the call set-up is to be over an open circuit, set the
call up to the $B$ subscriber according to 4.4 next page
If the calt set-up is not to be over an open circuit
Press SPB to split the connection
0 A the speech connection with the A subscriber is broken

## ACTION

## AXNOWLEDGziEi

APPENDIX 12. (Cont'd) DETAILED CALL HANDLING PROCEDUṘE
Calling_the_B_subscriber
Press B to set up a call to the B subscriber.
The light intensity is dimmed on the information written in. The analysed
B number is set up in the B-NR fietd.
White call set-up is in progress B condition CALLING is shown. When the call
is established the condition is changed to RINGING and a ringing tone is heard, if the B subscriber is free.
In the event of congestion the B condition CONGESTION is shown.
If the $B$ subscriber is busy a busy tone is heard and the $B$ condition BUSY is shown. In certain cases the busy tone is heard at the same time as the $B$ condition RINGING is shown. The $B$ subscriber is busy in this case also and the text BBUSY shall be written in the ORDER field and TRANSMIT pressed.
The call is then handled in the case of congestion or busy according to 4.9 page 37
Trunk offering to a busy $B$ subscriber inside the country is performed according page 42

 in the ORDER fietd and TRANSMIT is pressed. Continue the Lع abed to 5.1 - 5.5

|  |
| :---: |

The B subscriber answers. The B condition is changed to ANSUER

$\begin{array}{ll}\text { APPENDIX 12. (Cont'd) } & \begin{array}{l}\text { DETAILED CALL HANDLING PROCEDURE } \\ \text { FOR SUCCESSFUL DEMAND CALL. }\end{array}\end{array}$ FOR SUCCESSFUL DEMAND CALL.
4.6 Ihe_soll_establishment_ready

Inform the A subscriber that the call establishment is ready.

Press IIME START to prepare the start of charging. Time metering does not start until through-connection (SM pressed)

TOS *

APPENDIX 12. (Cont'd) DETAILED CALL HANDLING PROCEDURE FOR SUCCESSFUL DEMAND CALL.

Throughzeqnestion

## WCKNOTEDGEMEM

If the call does not get under way time metering can be stopped by pressing TIME START aga in. The time metered is then set to zero with RES TIME.

The operator can change to monitoring position before pressing TIME START in which case the time metering of the call does not start untit the call has commenced ond TIME START is pressed. The acknouledgements will be the same as the above except that * is omitted in the tos field.

APPENDIX 12. (Cont'd) DETAILED CALL HANDLING PROCEDURE
AGKNDHEDGEAETII The ticket disappears from the display.
The position is now free for a new call.

# Operator system AnE40 

## Contents

Introduction
Design and features
Ergonomics
Examples of traffic cases
Supervisor positions
Mechanical structure
Power supply
Operation and maintenance
Training

## Introduction

Operator assisted traffic is not an obsolete technique. Even if the percenage of calls that need operator assistance decreases, a considerable amount of calls, depending on the general increase of telephone traffic, will still need operator assistance.
Furthermore, some services e.g. personal calls, collect calls, charging on a third party, will always or at least in the foreseeable future require the assistance of an operator
In order to reduce or slow down the rise in costs of handling operator as sisted traffic, when costs for wages and training are rising, a modern operator system must be both flexible and efficient. However, the designer of an operator system must always be aware that he is designdesigner of an operator system must always be aware that he is designing a man-machine
To meet these demands LM Ericsson has designed ANE 40, a new operator system to be used with Ericsson's SPC-systems AXE and AKE

## Design and features

 an SPC-exchange the paper ticket has been replaced by a data screen.In order to meet the requirements of a modern work station, thorough studies and experiments concerning the ergonomic factors have been performed. One of the main considerations has been the selection of a data screer that does not cause strain and fatigue to the eyes of the operators. The design of the operator position desk and chair as well as colours and lighting are factors which have been included in the studies and experiments. The modular design of the system permits changing parts of the system without affecting other parts. This is of great importance to enable adaptation of future teghnologies in the system, e.g. in the man-machine communications field.
Queues to the operators, delay call ticket handling, timing and charging are automatically handled by the system.

The operator position can either be located close to the exchange or in a remote location connected via a data link. This feature enables tions in localities others than in the exchange building and also perhaps in another city where operator staff is more available.
Each operator is assigned to an operator group handling one or more types of traffic. This means that each individual operator handles the traffic he/she has the knowledge of languages and training for. When an operator has signed on, which ever position he/she is sitting at, the type of traffic he/she is prepared to handle is automatically directed to that position.
The assignments of operators to groups and types of traffic to groups can, in order to adjust the organization to the traffic situation, be changed by commands from the chief operator. The lay-out of the "ticket" and the call handling procedures are within limits up to each administration to decide upon. As a result of the ergonomic experiments certain recommendations are available.
A separate training system is available where the operators can practice with simulated traffic.

ANE 40 in AXE 10
 Outgoing trunk cil
PCM terminal

ANE 40 in AKE 13

## Ergonomics

Some of the most important features are:
Introduction of data screens which eliminates the need to write tickets.
Automatic storage of the call data for bookings and delay traffic.
Automatic charging and storage of the charging information.
Universal operator positions that can handle all types of services.
Much shorter call handling times because of the automatization of routine work.
Better service for the subscribers because of faster set up of the calls and the provision of more sophisticated services.
-Possibility of connecting different types of computers to which the operators may have access, e.g. directory enquiry service, centralized interception service etc
Flexible queuing system for calls to the operators. Modular increases in the number of operator positions.
Possibility of remote location of the operator positions.

The strenuous and exacting work of switchboard operators places strict requirements on their working environment The environment must be quiet to allow concentration, but at the same time be stimulating and thus prevent fatigue.

The extensive architectural and psychological studies of the environmental problems are directly applicable to operators' rooms.

This applies also to Operator System ANE 40, which permits optional location
of switchboards and optional future
refurnishing thanks to the design of the operator's position and the simple cable terminations.

The design of the operator's position is the result of careful ergonomic studies and experiments. Both the chair and desk can be quickly and easily adjusted for each individual operator. The cathode ray tube has a green phosphon flicker and has a matt finish in ord ar not to give disturin order not to give distu bing relle lesk and the burs oreen hood have been selected so that they do not cause disturbing do not cause dre the picture and the surrounding areas.

## Eноmples of

## traffic cases

## Types of calls

The following are examples of calls that can be received at an operator's position

Calls from domestic subscribers.
Calls from operators abroad
Calls from operators within the country and from operators within the same exchange Calls initiated by ANE 40.
When a call arrives at the operator's position a "ticket" indicating the type of call is displayed on the data screen. Calls from a subscriber or from another operator are given an appropriate message from an announcing machine. The message, which indicates the type of service, the name of the telephone exchange etc, is heard by both the calling party and the operator. The call is acknowledged by the operator pressing a key. If the call is not acknowledged within a certain period of time, the call is automatically transferred to another operator.

## Call types and operator groups

All calls are assigned a certain call type depending on the service language to be used, whether it is a national, international, incoming or outgoing cal etc. Each call type can be handled by one or more operator groups and an operator is always selected in the operator group with the lowest traffic level. Each operator can have its own signature which defines the operator group he/she belongs to. Thus an operator can use any position.

A call will be allowed to wait in the call queue for a certain time if no free operator is available. Whenever an operator becomes free the call queue is always examined for waiting calls before any new calls will be accepted. There is one queue for each call type.

## Reception of information

In the "ticket" on the screen the operator enters the verbal information received from the calling subscfiber or operator. In the normal case he/she writes e.g. the following information

- The calling subscriber's number.
- B-number, i.e. country code (if any), trunk code and directory number.
The category of the call.
- Whether the subscriber wants a personal call. - The party to be charged.

## Identification of the A-number

If facilities are provided for automatic transfer of the A-number, the A-number is indicated on the "tick-A-number, the A-number is indicated on the "ticket" in connection with the call. In cases where thereare no facilities for automatic transter, the Anumber could be checked by trunk offering ting up a new connection to the calling subscriber.

## Calling of B-subscriber

The selection and connection of a path to the Bsubscriber is initiated by pressing a key on the operator's keyboard. When the connection is established the B-subscriber's state is indicated on the screen (free, busy or inaccessible due to congestion).

## Start of charging

After the establishment of a connection between the $A$ - and $B$-subscribers the operator orders start of recording of the conversation time.

## Booking of delay calis

When a direct setting-up operation cannot be completed and the subscriber wants to make the call later on the operator completes the direct setting-up operation by ordering a delay call before he/she releases the position.

## Trunk offering and supervision

Trunk offering and supervision can be performed owards a busy subscriber. The call handling rules ssued by the administration should state the situations and subscribers which may be subject to trunk offering.
ANE 40 is able to take over the supervision towards a busy subscriber and - when he becomes free call a free operator.

## Searching

Searching means that an operator can order the display of a "ticket" on the screen. This is done by writing a search order and the parameters necessary to find the "ticket"
The searching facility may be utilized in connection with traffic handling, e.g. in the following cases:

- When a subscriber, who has booked a call for later handling, wants to change the priority, the hour of handling, the type of call, or cancel the booking, etc.
When the person wanted calls the operator for a personal call or a messenger call.

When an operator in another exchange reports that a transter booking is completed
When an operator requests the duration of a finished call.

## Supervision of a call in progress

For some calls in progress monitoring of the connection must take.place at regular intervals.
The type of call to be monitored - as well as the interval of monitoring - is determined automatically by the system during the setting-up of the connection. Monitoring can also be ordered by the opera-

## suernesor posicos

Introduction
There are two hierarchic levels of supervisors in the ANE 40 system viz, assistant supervisors and the chief supervisor.

Chief supervisor

## Assistant supervisor

The assistant supervisor position has two data screens. One is used for traffic handling "and for answering internal inquiry calls, the other for supervision only
The supervisor can obtain information about the number of occupied positions in the supervised group. For this purpose there is a special form which is set up on the supervision data screen by request of the supervisor.
The supervisor can connect his/her position to any position in the supervised group. He/she will then get a "copy" of the "ticket" at the supervised position on the traffic handling data screen. There is also an audio connection to the supervised position by which it is possible to
listen or talk to the operator.

## Chief supervisor

The chief supervisor position has two datarscreens and a typewriter. Thes
ing operators and for order's to the system from the chief suparviso-
Some examples of these orders to the system are:
$\left.\omega^{* t}+\alpha^{t}+,+\infty\right)^{2}$ to block some types of incoming traffic
to change the alarm level (the longest waiting time) on incoming

## queues

tion partly as described used partiy as for the assistant supervisor po
the supervision data screen about the occupation condition information on
tors, the queues, the routes and the operator groups.
The chist supervisor can
The chief supervisor can get the occupation condition for all operators in the system and can supervise all of them, one at a time.

The chief supervisor can order the display of a maximumot 64 queues on the supervisond number of waiting screen. For every queue the queue identification, to
subscribers in the queue will be displayed. When the longest waiting the ares.
formation on the screen. formation on the screen. There is also a special form to indicate the route con tire identity of the route when

the system and can supervise all of them, one at a time all operators in

## Mechanical structure

## Power supply

The packaging structure in which the operator system is built is partly determined by the telephone exchange system, to which the operator system is connected. When connected to an AXE exchange the packaging structure BYB is applied for both the switching and terminal part. When the connection is made to an AKE exchange the packaging structure BDH is used for the switching part and the packaging structure BYB for the terminal part.

## The switching part

The switching part is built up on printed circuit boards with discrete com ponents, integrated circuits and miniature relays. This part of ANE 40 is intended to be collocated with the other switching equipment in the switchroom

The terminal part
The terminal part is always placed in the packaging structure BYB
The terminal part is divided into an adjacent part and a remote part. The adjacent part is a unit handling the in terwork towards the controlling telep hone exchange. The unit is based on an Ericsson minicomputer of type APN 163. The control unit include interface circuits toward the data links and software functions for the com munication procedures on the links.
The remote part is also based on the minicomputer of type APN 163 and includes control unts for keyboard and data screen, DC/DC converter and various connecting boards.

The units are built up on printed cir cuit boards and inserted in a number of magazines. The adaptation units for the headset are also placed in the remote part. The entire equipment in the remote part is housed in two BYB cabinets which, when desired, can be placed in the switchroom. When the remote part is located more than one kilometre from the adjacent part modems are required for the data transfer.

## Operation and maintenance

## Training system

The operation and maintenance functions for the Operator System ANE 40 are designed according to the LM Ericsson maintenance philosophy Controlled Corrective Maintenance (CCM). In brief, this implies the following:

- continuous fault supervision or automatic routine tests detect faults in the system.
detected faults are analyzed so that only a disturbing fault state or fault level is reported to the maintenance staff, usually by means of an alarm system.
automatic fault indication or fault diagnosis is made as far as possible, and is supplemented with documented routines for manual fault localization and repairs etc.
collection of statistics to plan (dimension) exchanges and the network. The ANE 40 system also includes traffic supervision functions comprising supervision of queues, recording of utilization of operator service etc. The chief operators and supervision operators handle this supervision.
The administrative functions are divided with respect to their handling between exchange maintenance and operator staff. The maintenance staff handles blockings, exchange data modifications, traffic recording etc. The chief and supervision operator handle changes in queue priori-
ties, organizational changes etc. ties, organizational changes etc.
Alarms, fault printouts, commands for blocking/deblocking, etc. which primarily are associated with the maintenance of the equipment, are included in the normal operation and maintenance organization of the exchange.
The traffic supervision and commands to modify queue priorities, organization, traffic handling etc. are included in the operator organization. These functions are handled by the chief operator by means of a supervision terminal and a typewriter.

## Traffic recording

All calls to the operator system are distributed on different call types. The respective call types are then forwarded to operator groups. Each operator group consists of a number of operators for a certain traffic category. Recordings of the traffic to the operator groups are mainly used for supervision of the traffic load. However more detailed recordings can be made on the call types, since all queues are oriented to the call type.

Within the Operator System ANE 40 there is a training system which is used for training of operators. This system can also be used for evaluation and development of call handling procedures.
From a trainee position different traffic cases can be practised (with or without assistance from the teacher). Any handling procedure used in the real operator system can be simulated in the training system. The equipment at the trainee position is the same as at a normal operator position and the information to and from the positions is the same as when handling normal calls.
The system can be installed as a completely separate system or by conThecting ordinary positions to training positions, be incorporated in the operator system.
The traffic cases are prepared and fed into the control processor. The The traffic cases are prepand the trainees are connected. The execution terminals for the teacher and the the control processor. In the data is specified what the control processor shall write on the trainee data screen and what the trainee shall write on the data screen and which functional keys to operate.
The training system consists of a teacher position and a maximum of 14 rainee positions. Any position can with a command from the teacher be and connected to the teacher position. Fromithe teacher position it is poss and acoustically.

[^0]:    ** $p<0.01$ ) Binomial test $\quad$ (The symbol $>$ is here used to mean "is significantly preferred to". For instance $* p<0.05$ ) Binomial test $A 1>A O$ means that $A 1$ is significantly preferred to AO on that characteristic.
