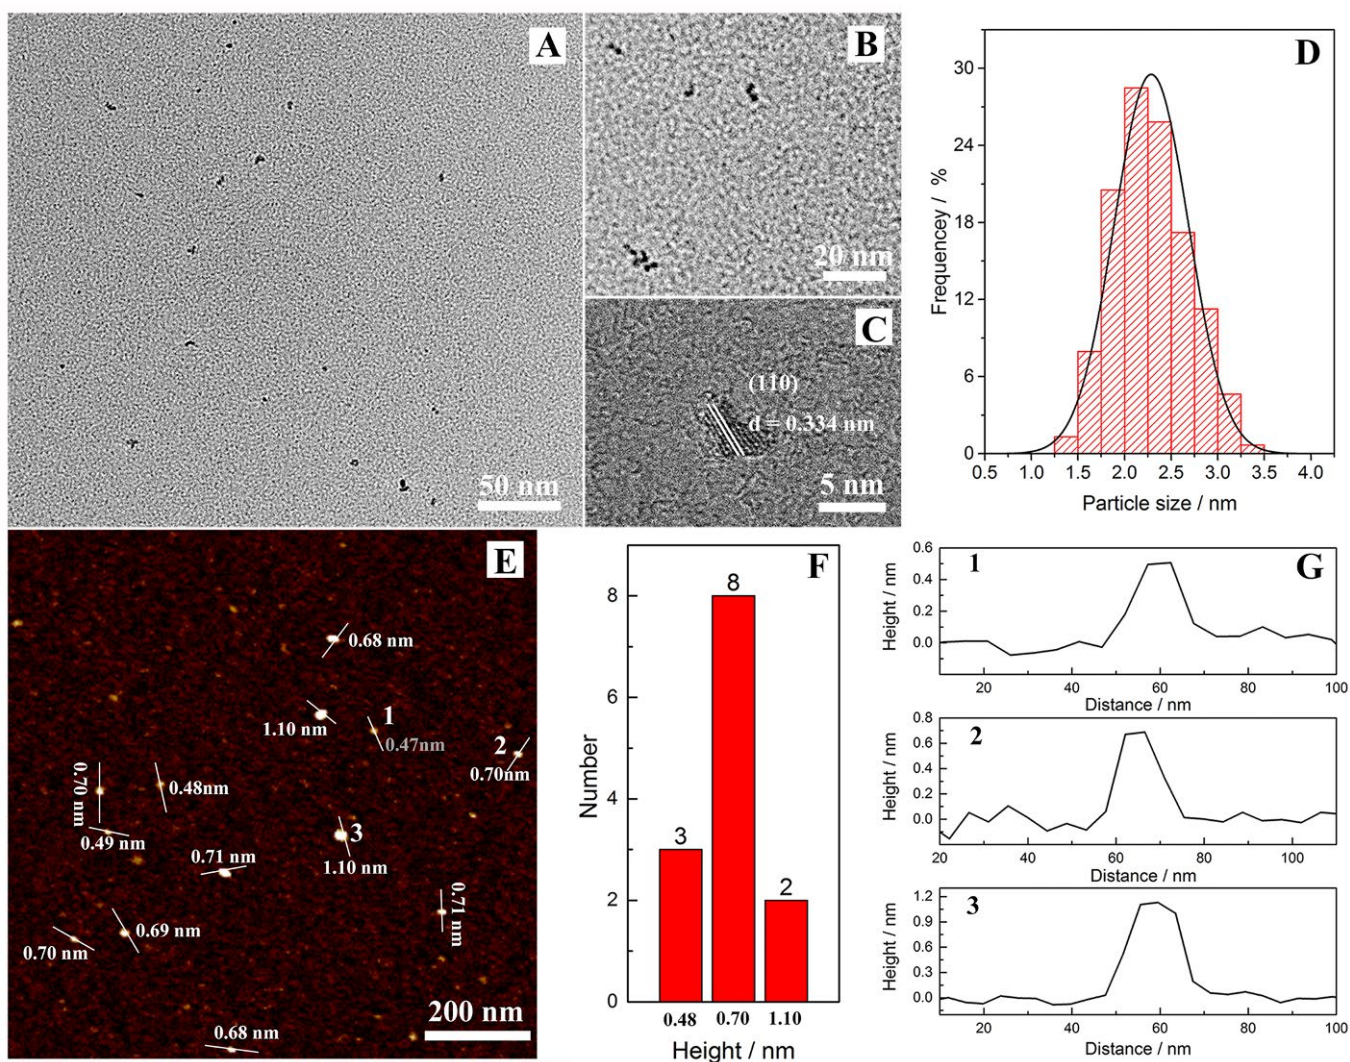

**Figure S1.** (A) Illustration of a new 'probe-type' on-line DEMS system; (B) Designing drawing of the on-line DEMS electrochemical cell.

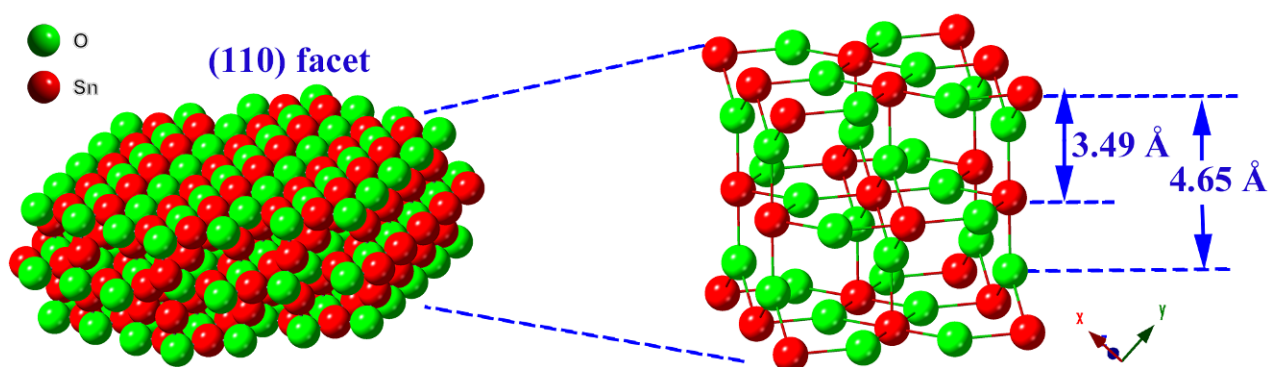

**Figure S2.** CO stripping curves of JM Pt/C (A) and Pt-SnO<sub>2</sub> /rGO (B), also shown are the corresponding MSCVs of CO<sub>2</sub> ( $m/z = 44$ )

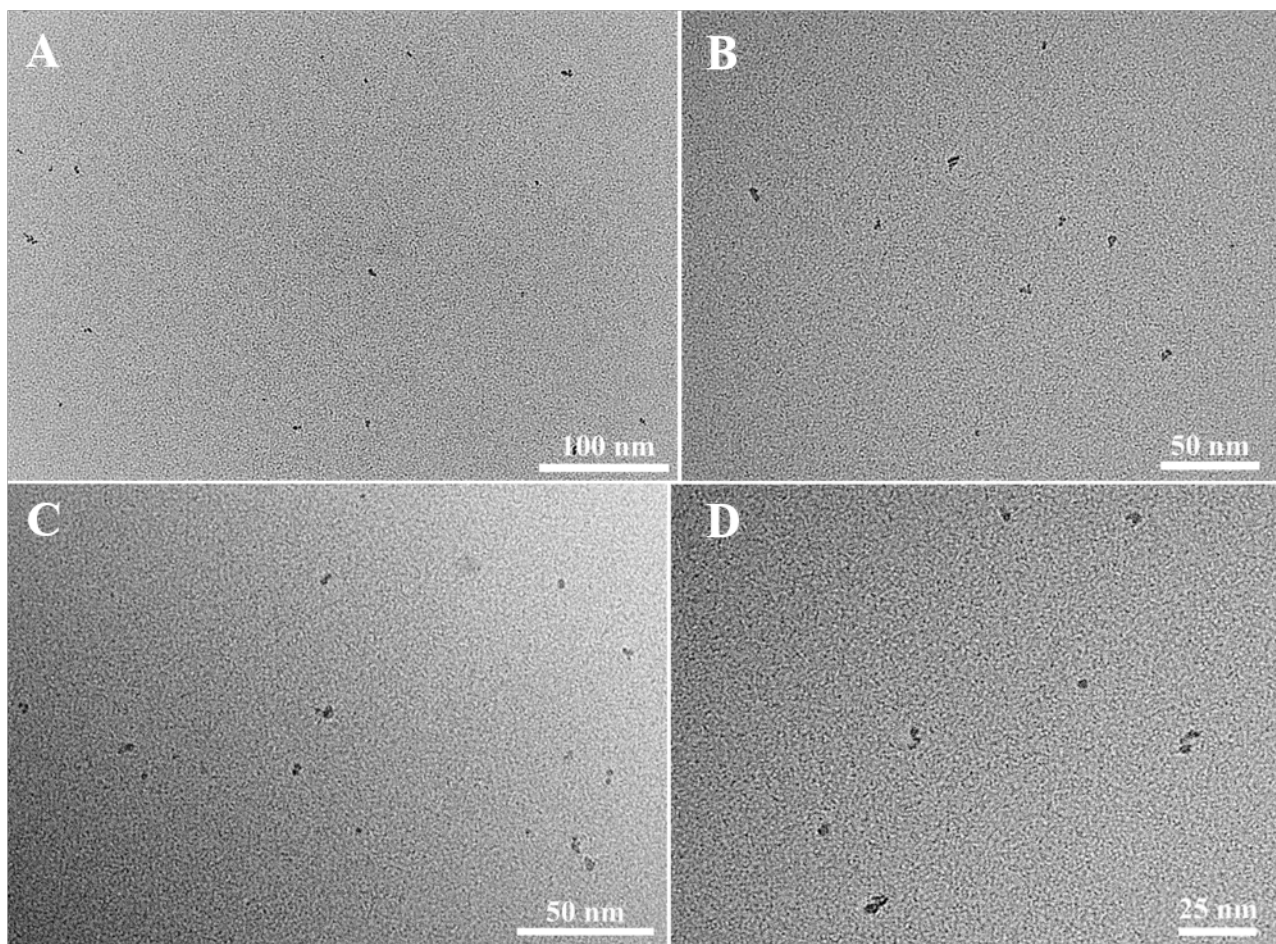

**Figure S3.** (A-D) TEM images of the as-prepared Pt-SnO<sub>2</sub>/rGO composites, (E) HR-TEM images of Pt-SnO<sub>2</sub>/rGO, (F) Atomically resolved HAADF-STEM image of Pt-SnO<sub>2</sub>. Left inset is the FFT of the image (F). From the HR-TEM images, the lattice distance of Pt overlayer on SnO<sub>2</sub> was found to be 2.33 Å. This is slightly larger than that of the Pt (111) (2.26 Å), which could be ascribed to the tensile strain effect from the SnO<sub>2</sub> substrate. The Pt-SnO<sub>2</sub> nanoflakes in HAADF-STEM image (Figure S1F) were founded to be oriented along the [011] direction with (111) and (002) facets being the abundant truncating lattice planes, which were further confirmed by the corresponding fast Fourier transform image.

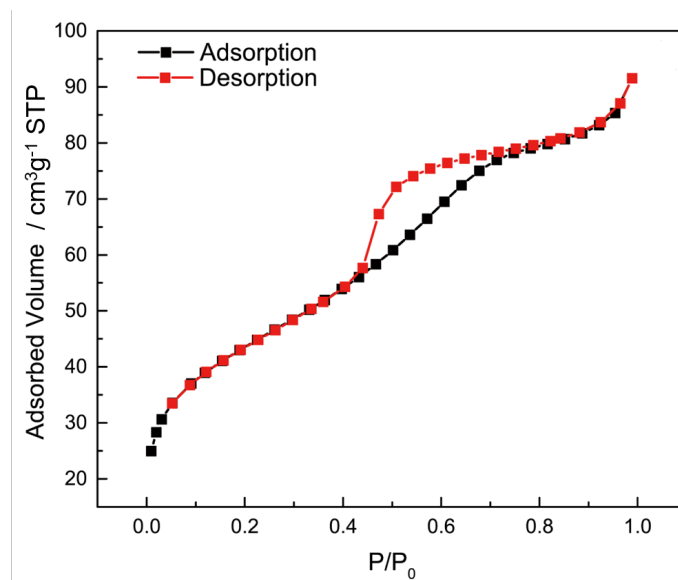

**Figure S4.** SnO<sub>2</sub> nanoslices characterization. (A-C) Bright field (HR-)TEM images, (D) size distribution, (E) AFM image with marked white line and number showing the height of certain SnO<sub>2</sub> nanoslices, (F) corresponding height distribution and (G) height profiles.

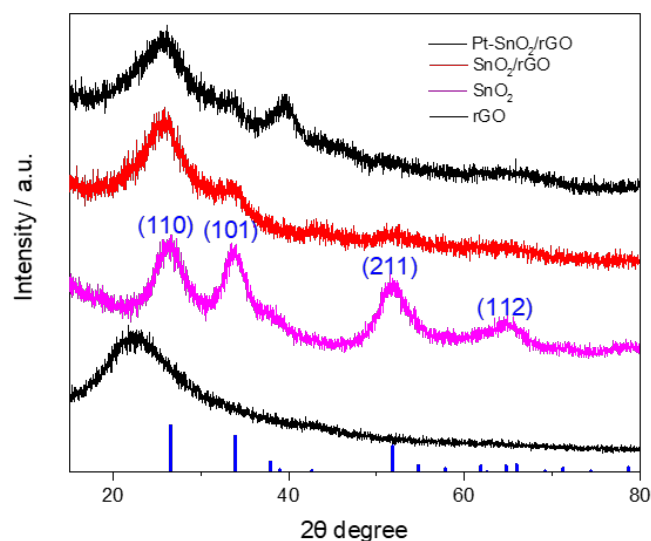

**Figure S5.** Schematic illustration of ultrathin SnO<sub>2</sub> nanoslices.

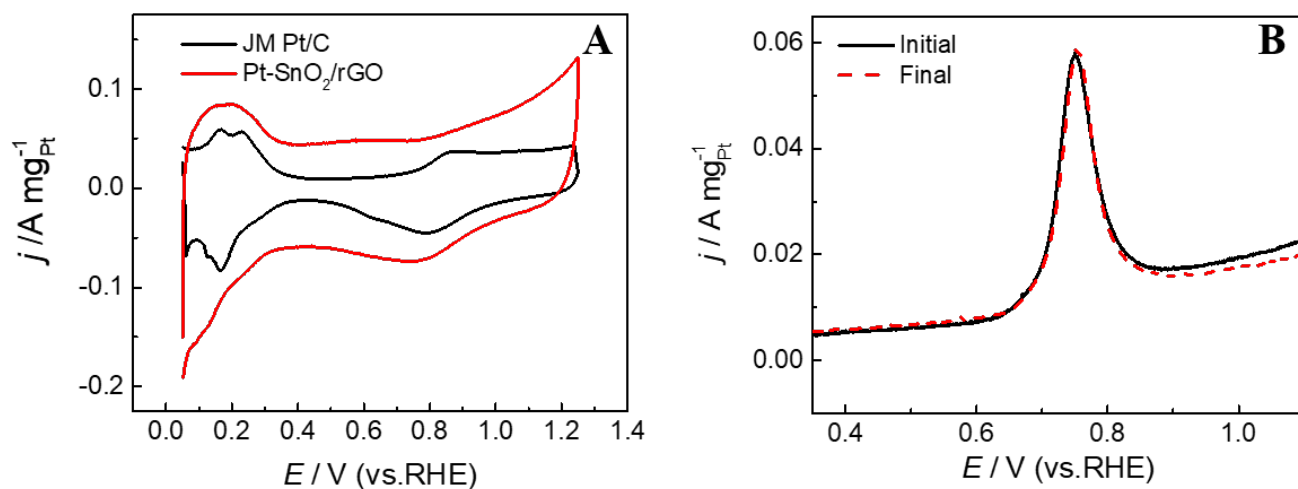

**Figure S6.** Additional TEM images of SnO<sub>2</sub> nanoslices.

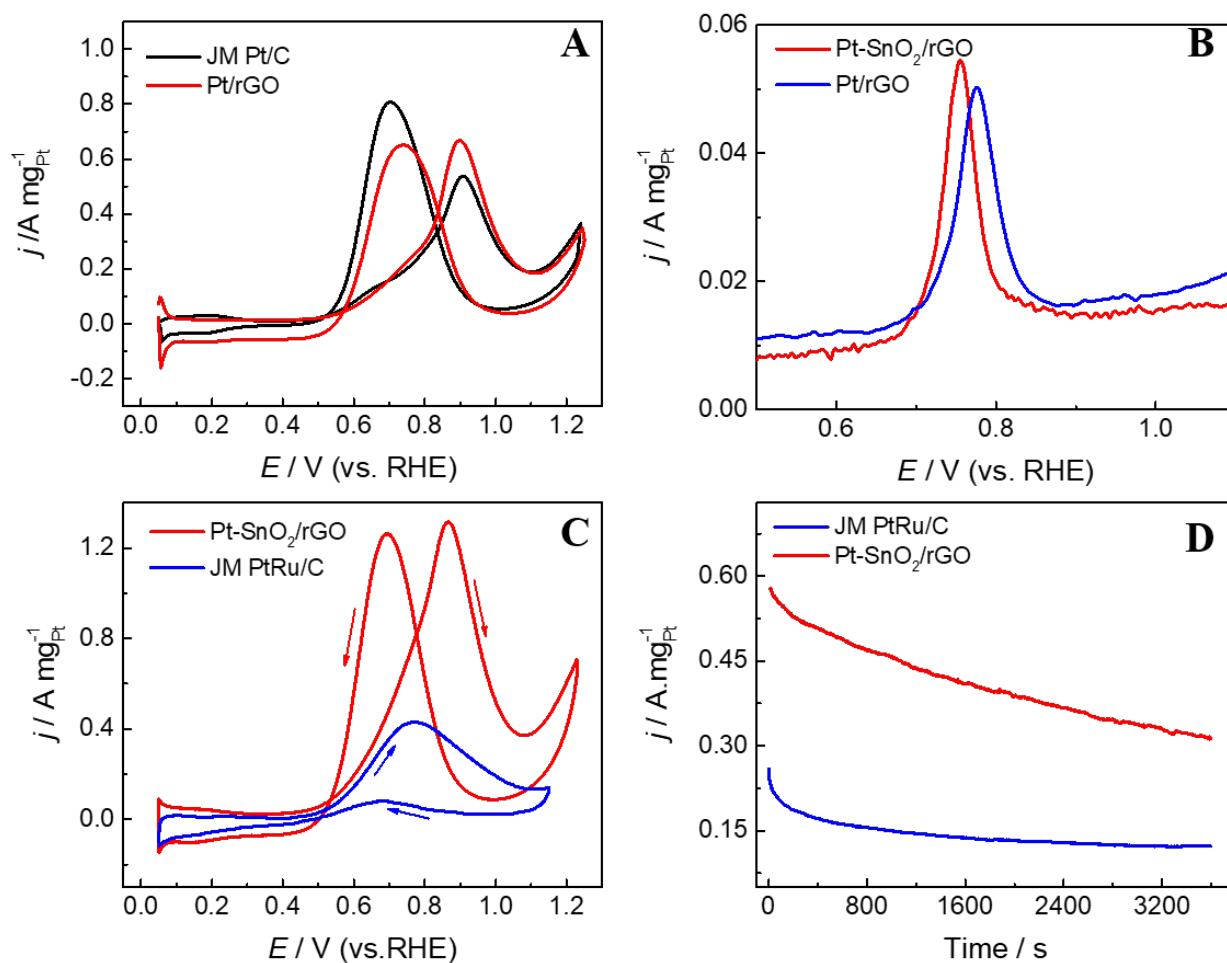

**Figure S7.** N<sub>2</sub> sorption isotherms of ultrathin SnO<sub>2</sub> nanoslices. The special surface area of ultrathin SnO<sub>2</sub> nanoslices was estimated to be about 151.95 m<sup>2</sup> g<sup>-1</sup> from the N<sub>2</sub> sorption isotherms.

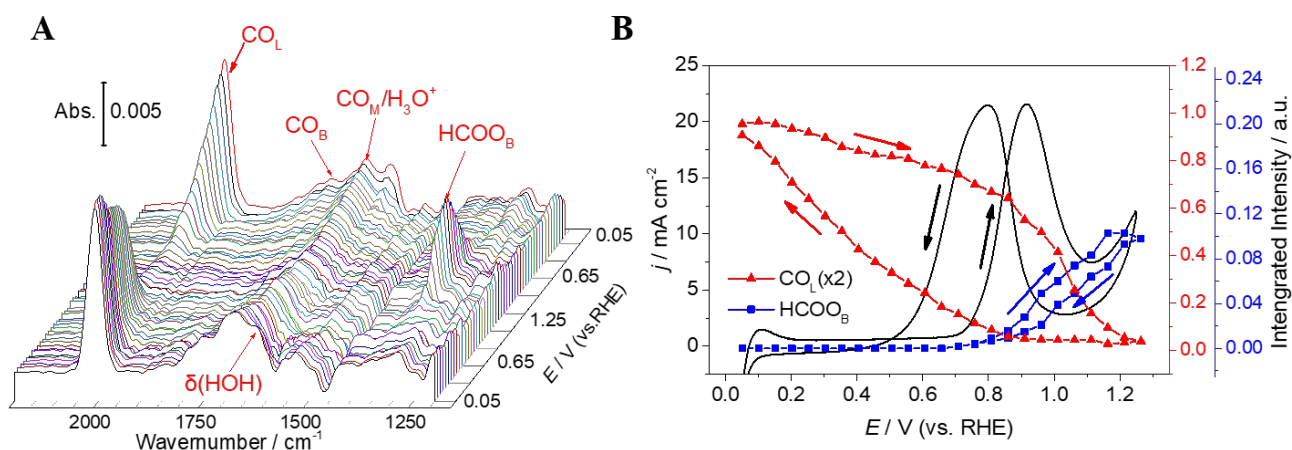

**Figure S8.** XRD patterns of reduced graphene oxide (rGO), SnO<sub>2</sub> powder, SnO<sub>2</sub>/rGO and Pt-SnO<sub>2</sub>/rGO composites. The blue lines are indexed to the tetragonal structure of SnO<sub>2</sub>, corresponding to JCPDS No. 88-0287.

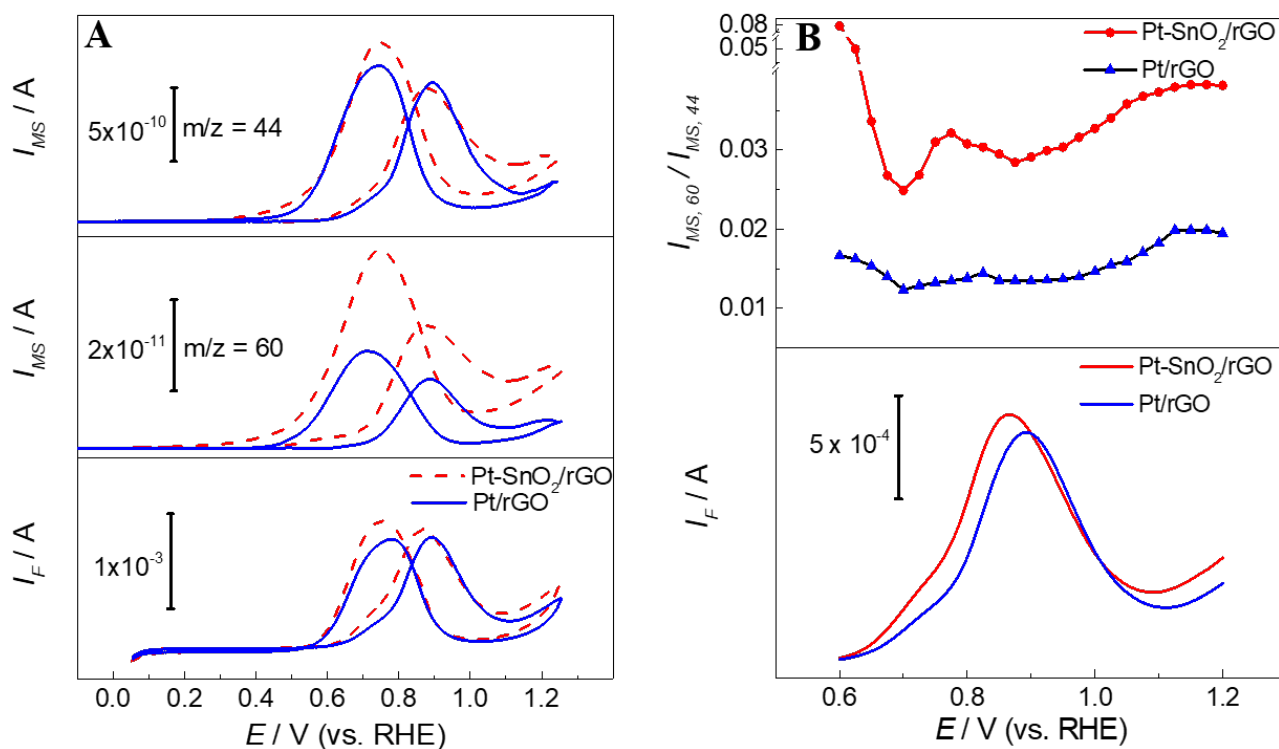

**Figure S9.** (A) CV curves of Pt-SnO<sub>2</sub>/rGO and JM Pt/C in 1.0 M HClO<sub>4</sub> at a scan rate of 50 mV/s, (B) The CO stripping curves of Pt-SnO<sub>2</sub>/rGO in 1.0 M HClO<sub>4</sub> before and after the chronoamperometric test.

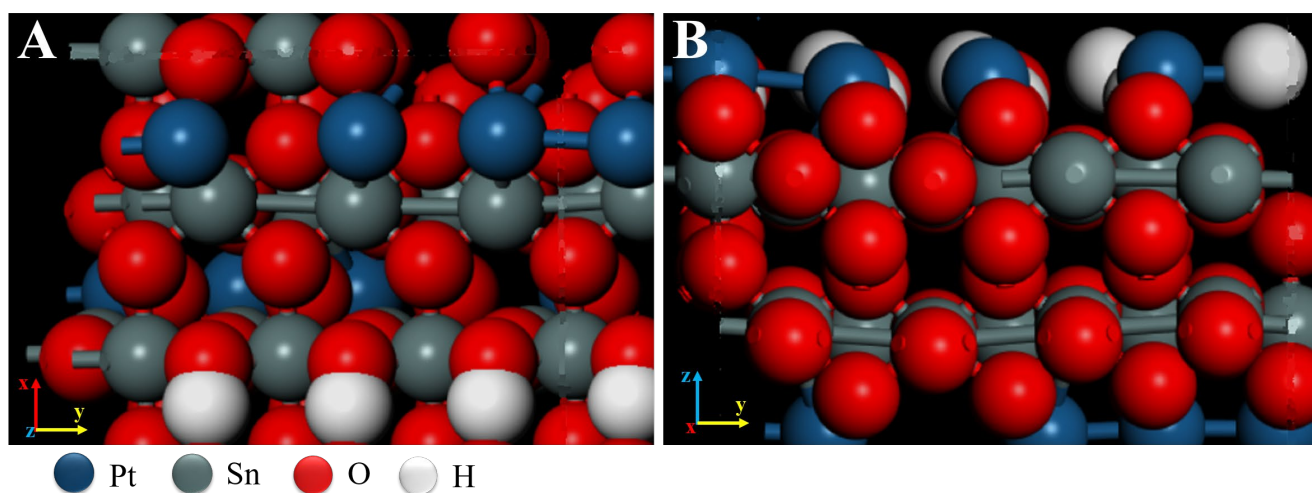

**Figure S10.** (A) Pt/rGO vs. JM Pt/C, CVs were recorded in 1 M HClO<sub>4</sub> + 1 M CH<sub>3</sub>OH at a scan rate of 50 mV/s, (B) The CO stripping curves of Pt-SnO<sub>2</sub>/rGO and Pt/rGO in 1.0 M HClO<sub>4</sub>, (C) Pt-SnO<sub>2</sub>/rGO vs. JM PtRu/C, CVs were recorded in 1 M HClO<sub>4</sub> + 1 M CH<sub>3</sub>OH at a scan rate of 50 mV/s, (D) Chronoamperometric curves of Pt-SnO<sub>2</sub>/rGO and JM PtRu/C recorded at 0.70 V (vs. RHE) in 1 M HClO<sub>4</sub> + 1 M CH<sub>3</sub>OH.

**Figure S11.** In situ ATR-SEIRAS spectra for (A) Pt/rGO in 1 M HClO<sub>4</sub> + 1 M CH<sub>3</sub>OH with a time resolution of 5 s, using a single-beam spectrum at open circuit potential in 1 M HClO<sub>4</sub> as the reference spectrum, (B) Corresponding CVs of (C) Pt/rGO at a scan rate of 10 mV/s with the integrated band intensities of CO<sub>L</sub> and HCOO<sub>B</sub>. Current densities were normalized by geometric electrode area of 0.785 cm<sup>2</sup>, and a constant catalyst loading was used for ATR-SEIRAS measurement, leading to an actual Pt mass loading of 0.55 mg<sub>Pt</sub>/cm<sup>2</sup> for Pt/rGO.

**Figure S12.** (A) Simultaneously recorded CVs and MSCVs for  $m/z = 44$  and  $m/z = 60$  on Pt/rGO and Pt-SnO<sub>2</sub>/rGO in 1 M HClO<sub>4</sub> + 1 M CH<sub>3</sub>OH at scan rate 5 mV/s; (B) the corresponding potential-dependent plot of the relative ratio  $I_{MS,60}/I_{MS,44}$  as measured from 0.60 V to 1.20 V.
